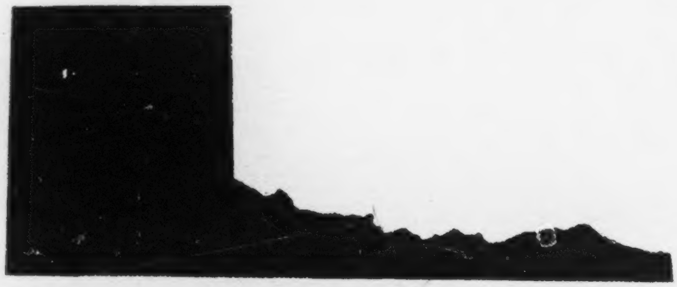
TEXAS OCCUPATIONAL EMPLOYMENT STATISTICS



INDUSTRY STAFFING PATTERNS FOR SELECTED NONMANUFACTURING INDUSTRIES

TEXAS EMPLOYMENT COMMISSION
In cooperation with the U.S. Department of Labor
Bureau of Labor Statistics and the Employment
and Training Administration

TEXAS OCCUPATIONAL EMPLOYMENT STATISTICS

INDUSTRY STAFFING PATTERNS FOR SELECTED NONMANUFACTURING INDUSTRIES

2nd QUARTER 1978

Prepared by
Texas Employment Commission
Economic Research and Analysis
TEC Building
Austin, Texas 78778

Issued December 1979

PREFACE

We would like to express our appreciation to all the employers who willingly contributed their time and effort in completing and submitting the questionnaires as we requested. Their cooperation is what made this report possible. The statistical data contained in this report was compiled from the information received from employers' responses. To each of these respondents we extend a sincere thank you.

Another contribution that we feel was invaluable to our endeavor was made by the staff of the U. S. Department of Labor and the Bureau of Labor Statistics Regional Office in Dallas.

Bibliography.......... 117

INTRODUCTION

The Occupational Employment Statistics (OES) Program is a part of a Federal-State Cooperative Program involving State Employment Security Agencies in conjunction with the Employment Training Administration and the Bureau of Labor Statistics. The Program furnishes current estimates of industry staffing patterns by occupation through periodic surveys of the nonfarm wage and salary sector of the economy. Texas has been involved in this Program since 1974 and is one of 46 participating states.

The OES Program is designed to: (1) provide accurate profiles of occupational resources by industry and trends in the number of workers employed by occupation, (2) aid in projections of future manpower requirements by industry and occupation, and (3) identify emerging and disappearing occupations. This information will help in the development of educational and training programs and will also provide valuable information for employment counselors and manpower planners. Data is generated to show the occupational profile of selected industry groups so that individual firms will be able to compare their occupational staffing patterns to that of the industry of which they are a part. This data will later be used to refine and modify the worker-demand projections generated through the occupation-by-industry Matrix Program.

This report represents Nonmanufacturing data collected during the survey period. All respondents were requested to include employment data for the appropriate survey month--April 12, May 12, or June 12 of 1978.

This publication, and others of its type to follow, will be continually updated, as well as improved, to provide a better basis for decision-making at all levels of human resource planning and development.

METHODOLOGY

The Sample

The Third Quarter 1977 Report of Employment, Wages and Contributions Covered by the Texas Unemployment Compensation Act was used as a sampling frame for the Occupational Employment Statistics Survey of Nonmanufacturing Establishments.

The sampling frame was stratified by three-digit (in some cases two-digit) SIC (Standard Industrial Classification) codes and by nine employment size groups and was then collapsed to seven classes of employment: 1-9, 10-19, 20-49, 50-99, 100-249, 250-499, and 500 plus. Establishments with over 250 employment were automatically included in a separate size class and were picked with certainty. All other establishments were subject to sample selection on a random basis, with the units in larger size classes having a proportionately higher chance of selection. Each unit was given a weight according to the proportion of firms selected in each size class. The sample included 20,867 establishments with a represented benchmark employment of 1,408,058.

Sampling Error

The sampling error is an arithmetic measure of the precision of the estimate. It can be considered as the difference between the estimate computed from the sample and the results that would have been obtained if the same methods were used to collect identical information from the universe (all available establishments). The relative errors listed in this report are the absolute sampling errors of each occupation expressed as a percent of that occupational estimate. This measure of precision is on the same base, a percentage comparison. The relative errors shown in this report are such that the chances are two out of three (68 percent) that the results of such a complete survey of all firms would not differ by plus or minus one relative standard error from the OES occupational estimates, and an interval of two relative standard errors will yield a 95 percent confidence level. For example, the OES estimate of employment in the Austin SMSA Banking Industry (SIC 60) for the number of tellers employed was 500 with a relative standard error of 2.52 percent. The chances are two out of three that the true number of workers employed in that occupation at the time of the survey was between 487 and 513 (500 ± .0252 x 500), and we may be 95 percent certain that the true number fell between 475 and 525 (500 ± 2 x .0252 x 500). The relative standard error allows the user to judge, with a given degree of confidence, the quality of any particular occupational estimate. It is a measure of the relative dispersion within the data collected, and indicates the occupational coefficient of variation of the population from which the sample was drawn.

Nonsampling Error

A survey of this magnitude is going to have a small degree of nonsampling error. Examples of these errors are faulty questionnaire design, inaccuracy of data furnished, ineffective processing, and nonresponse. The possibility of errors in the design of and the data furnished by the questionnaires, as well as errors in processing, was recognized from the start of the survey. Every effort was exercised to avoid and control them. The nonresponse area was handled to a large degree by the built-in variables of the sampling and estimating process. This process takes into consideration that the occupational distribution of the nonreporting sample unit in a given three-digit employment size class is the same as among the reporting establishments of that size class.

Estimating Procedure

A ratio method, an established statistical procedure, was used throughout the report. Any given size class of any given industry represents an estimating cell. All establishments in a given cell are assigned a sample weight which is the inverse of the sampling ratio. There is a direct relationship between employment and the number of units within a size class to determine the ratio, or the probability of sample selection. The employment for any specific occupation in each establishment is inflated by its sample weight and summed for all sample establishments in the cell. A ratio is then derived of the weighted employment for each occupation to the weighted reported total employment. This ratio is then multiplied by the benchmark employment for that estimating cell as of the appropriate survey month--April 12, May 12, or June 12 of 1978, thus yielding the occupational make-up of the estimating cell for that date. Like occupational employments are summed across all employment size classes within each three-digit SIC to arrive at a total industry employment for each occupation. Two-digit estimates of occupational employment were derived by summing estimates across three-digit SIC industries.

Collection Procedures

The majority of the data was collected by mail. Survey operations included an initial mail out and two follow-ups to nonrespondents (in some cases three, where nonresponse was a critical factor). The telephone was used extensively to clarify information, handle critical nonresponse areas, and prompt small and medium-sized respondents to furnish survey data.

CONSIDERATIONS OF THE USES OF THE ESTIMATES

Relative Error

Relative error is a measure of precision and expresses the absolute sampling error of an estimate as a percentage of that estimate. From an accuracy standpoint, the higher the relative error - the less accurate the estimate. If relative errors exceeded fifty percent, the employment from these occupations was merged with the employment of the "all other" residual category that was relevant to them.

Throughout the tables, it should be noted that the relative error is computed only for specific occupations and not for residual categories nor for occupational groupings. These are noted by "na" (not applicable).

Rounding Errors and Occupations With Employment Less Than Thirty

All percentage estimates were carried out to two decimal places with the exception of the percent of establishments reporting the occupation. These percentages were rounded to the nearest whole number.

In each SIC (Standard Industrial Classification), many more occupations were surveyed than are actually shown in the tables. Occupations which had employment of less than thirty were suppressed, and their employment was added to the residual category for their major occupational group.

Industrial Classification With Statewide Employment of Less Than Three Thousand and Area Employment of Less Than One Thousand

Some of the industry groups surveyed had an insignificant amount of estimated employment--statewide less than three thousand, and areas less than one thousand. In order for the user to have meaningful occupational staffing patterns, the industry was suppressed or collapsed to the major two-digit industry group totals.

STAFFING PATTERNS
FOR
SELECTED INDUSTRIES

INDUSTRY CHARACTERISTICS

HIGHLIGHTS OF SURVEY FINDINGS

The industry tables in this publication represent industry employment data divided into the major occupational categories: (1) Managers and Officers, (2) Professional and Technical Occupations, (3) Service Occupations, (4) Maintenance, Construction, Repair, Material Handling, and Powerplant Occupations, (5) Clerical Occupations, and (6) Sales Occupations. Even though most of these major occupational categories are represented in each industry, the distribution of employment among the occupational groups varies widely from industry to industry. The following information is for total statewide employment for each occupational category.

Managers and Officers - This category includes persons concerned with management functions common to many types of organizations, as well as occupations which require a knowledge of management and operations of a given organization. Managers and Officers account for only a small percentage (6 to 10 percent) in some of the personal services to as high as 20 percent in SIC 60 (Banking).

Professional and Technical Occupations - While there is a difference between Professional Occupations and Technical Occupations, for publication purposes, they are combined into a single group. Professional Occupations include persons concerned with the theoretical aspects of such fields as science, engineering, medicine, law, and business relations. Most of these occupations require substantial educational preparation, usually at the university level. Technical Occupations include persons actually engaged in technical work, utilizing theoretical knowledge of fundamental scientific, engineering, mathematical, computer programming, or draft design principals, comparable to those acquired through study at technical institutes, junior colleges, or other formal post-high school training less extensive than a four-year college course, or through equivalent on-the-job training or experience. Professional and Technical Occupations are only a small percentage of total employment in the industries surveyed, but are numerically important in several industries. Accountants and Auditors represent a significant portion (44 percent) of total employment in SIC 893 (Accounting, Auditing, and Bookkeeping Services). Business Computer Programmers, an important professional occupation, are found in most of the larger surveyed industries.

Service Occupations - This major occupational category includes workers in occupations concerned with the performance of services for persons that require either direct contact or close association with the individual; occupations concerned with preparing and serving food and beverages; and occupations related to the cleaning of the interior and equipment of buildings, offices, stores, and similar places. Service Occupations appear in nearly all industries and range from less than 0.5 percent of total employment in SIC 893 (Accounting, Auditing, and Bookkeeping Services) to

58 percent in SIC 836 (Residential Care). Numerically important occupations in this major category are Janitors, Porters, and Cleaners; Food Service Workers; Nurse Aides; and Child-Care Workers.

Maintenance, Construction, Repair, Material Handling, and Powerplant Occupations - Occupations in this group include all skilled, semiskilled, and unskilled workers performing machine and manual tasks involving maintenance, construction, repair, material handling, powerplant, mining, and processing occupations. While employment in this category did not appear in all industries surveyed, it was represented in a majority of them. The highest percentage (67 percent) of Maintenance and Production workers was in SIC 721 (Laundry, Cleaning, and Garment Services).

Clerical Occupations - These occupations include persons whose work involves preparing, transcribing, transferring, systematizing, and preserving communications and records; collating accounts and distributing information. Also involved in this category are clerical workers involved in planning, coordinating, or expediting production and the flow of work; and workers involved in the clerical aspects of receiving, storing, issuing, or shipping of materials, merchandise, supplies, or equipment. Though Clerical Occupations occur in all industries in this survey, they are especially important in SIC 60 (Banking) and SIC 63 (Insurance) where they account for 70 and 53 percent of the total employment, respectively. Some of the numerically important Clerical Occupations in the Banking and Insurance Industries are Tellers, Secretaries, General Clerks, Claim Examiners, and Accounting Clerks.

Sales Occupations - Included in this final major occupational group are Sales Representatives, defined as persons wholly or primarily concerned with selling when knowledge of the goods or services sold is required. Also included are Sales Clerks who sell any of a large variety of goods or services usually inexpensive and not requiring much more knowledge of the goods or services than the price. The largest group of Sales people in the industries surveyed is in the Insurance Industry--Sales Agents and Sales Representatives. Sales Clerks are found in many of the industries, with no strong concentration in any segment.

NONPUBLISHED EMPLOYMENT ESTIMATES

Not all industries included in the survey are contained in this publication. This exclusion can be attributed to one or more of the following reasons: (1) an individual respondent could be identified if data were published, (2) employment in a specific industry or industry group was less than that required for the development of occupational employment estimates, and/or (3) response in a given industry or industry group was less than that required for the development of occupational employment estimates.

GLOSSARY OF TERMS

Benchmark Employment: A term which is used to identify specific employment figure(s) which existed at a particular point in time. In the OES survey program, the term benchmark is used in two ways: (1) It is the establishment or industry employment that existed at the time the sample was designed. (2) When estimates are made, it is used again to refer to the total universe employment for each estimating cell as of the reference date of the survey.

Current Employment Statistics Program: A cooperating program between the Bureau of Labor Statistics of the Department of Labor and the participating states. The primary objective of the program is the preparation of current monthly estimates, from sampled employers, of nonagricultural employment, hours of work and earnings.

ES-202: A quarterly listing of employment and contributions of all firms covered under the unemployment insurance laws of Texas. From this listing, the Nonmanufacturing sample was selected.

Establishment: An economic unit which produces goods or services, for example: a consulting service, a factory, or a store. In most instances, each establishment is a single physical location and is engaged in one predominate type of economic activity for which an industry code is applicable. Establishments are also referred to as reporting units.

Estimating Cell: One size class in one industry.

Sample Weight: A numerical value that is assigned to an establishment during the sample selection. For example: if an establishment has an occupational employment of 25 and a weight of three, then for estimating purposes, the 25 employment will have a representation of 75 (3 x 25).

Sampling Error: The difference between data obtained from a sample and data which would have been obtained if the same survey methods were applied to collecting identical information from the entire population.

Sampling Frame: The sampling units actually available to sample.

Sampling Units: The establishments selected randomly from the universe.

Size Class: The stratification of an industry by employment. For example: establishments with employment of 10-19 would be in one size class, and those with employment of 20-49 would be in another size class, etc.

Standard Industrial Classification (SIC): A grouping of establishments primarily engaged in the same or similar lines of economic activity. In the Nonmanufacturing division, the line of activity is generally defined as any function that excludes Manufacturing, Wholesale and Retail Trade, Regulated Industries, and Government. Throughout this report, SIC's are correlated with a significant numerical designation. For example: SIC 60 is Banking, SIC 63 is Insurance, etc.

Standard Metropolitan Statistical Area (SMSA): Includes a city (cities) of specified population which constitutes the central city and the county (counties) in which it is located. A Standard Metropolitan Statistical Area also includes contiguous counties and may also cross state lines. In New England, Standard Metropolitan Statistical Areas are composed of cities and towns instead of counties.

Universe: Total amount of establishments or units covered under the Texas Employment Security Law.

Usable Response: All receipts which, after initial classification and schedule review, are judged to contain usable OES data.
